

ABSTRACT OF THE DISCLOSURE

An apparatus for adjusting width of drive channel of nailer has a slot defined at a side surface of a track of the channel assembly, in the slot [[thereof]] are defined a plurality of recesses and an adjustable push plate ~~are~~
5 ~~defined respectively, the push plate slidably positioned along with an~~
~~adjusting bolt disposed at the outer surface of the nailer, on the push plate~~
~~thereof corresponding to recesses~~ a plurality of blocks are defined on the push
plate, such that increase the width of track can be increased when ~~by virtue of~~
~~the insertion of the blocks~~ are inserted in the respective recesses, and alike, the
10 width of track can be reduced when ~~by virtue of~~ the blocks ~~abutting~~ abut
against the internal surface of the slot. By such a manner, the apparatus of the
present invention is capable of providing suitable drive channel for [[vary]]
different sized nails.
